

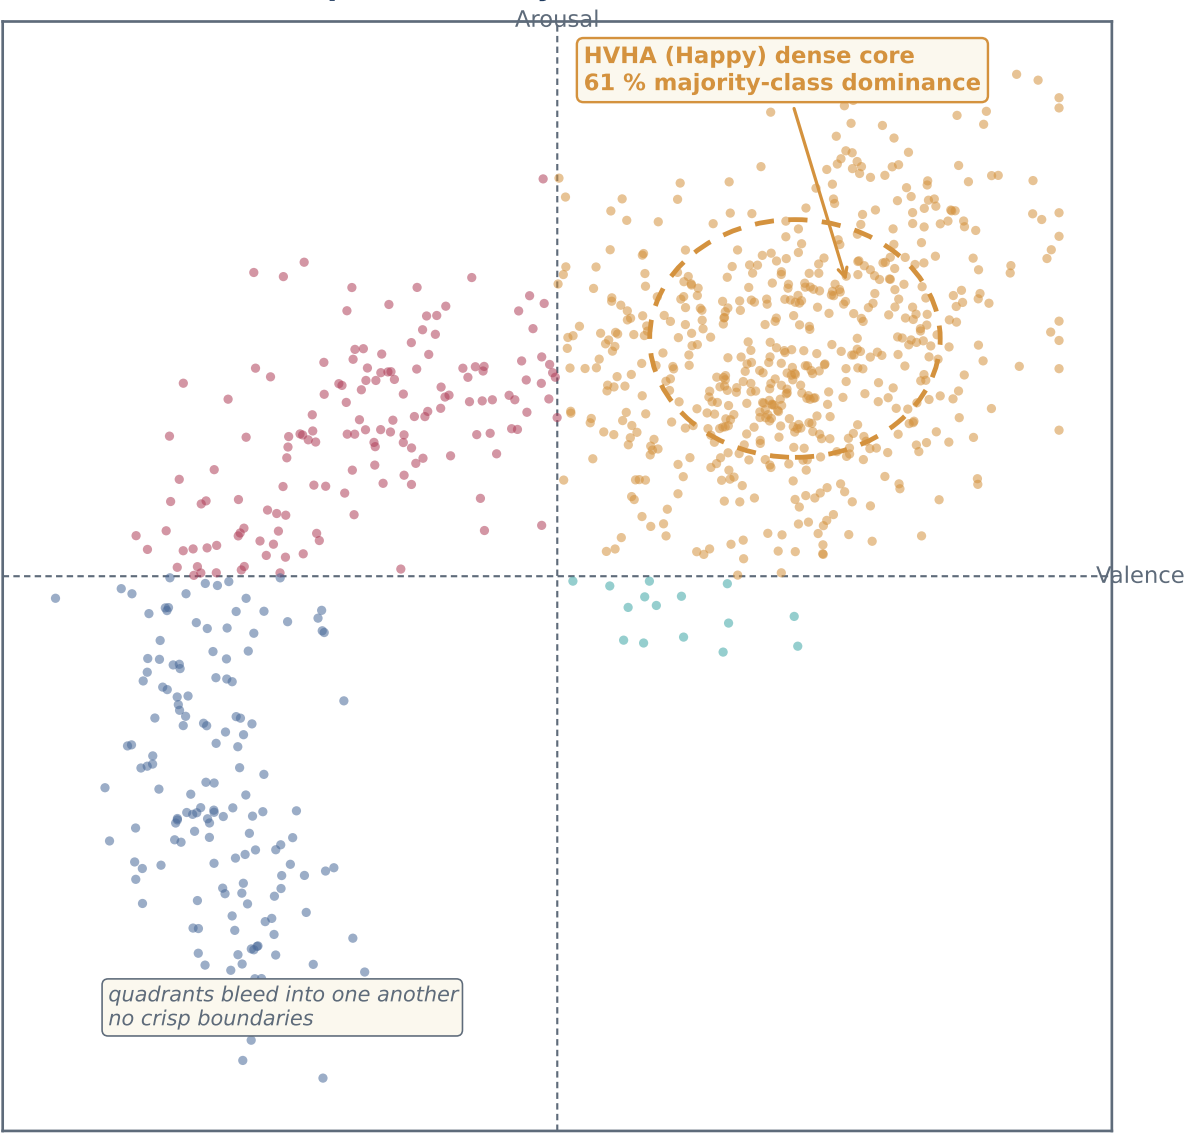

Figure 4 — Continuous Latent Manifold vs. Discrete Quadrant Typology

(a) The Trivial Hypothesis — Discrete Clusters

*Hypothesised Discrete Clustering
(not observed: clean separable clusters would give Silhouette ≥ 0.5 ;
canonical held-out value is ≈ 0.26 cosine — weak-to-moderate)*

(b) The Empirical Reality — Continuous Manifold

*True empirically-audited latent geometry
(continuous emotion gradient · Precision@5 optimisation space)*
